Know Why Your Learners Succeed, and Why They Quit

A clear, evidence-based picture of what helps people reach fluency, built from your own learner data.

45,000	36%	37%	4
learner records reviewed	reached working fluency	quit before getting there	dashboard pages delivered

1. The Problem You're Facing

You have information about thousands of learners: how long they studied, how they practised, how they felt about it, and how far they got. But it sits in a large file nobody has time to read. So the big questions go unanswered. Why do some learners reach fluency while others stop halfway? Which habits actually matter? Where is your effort being wasted? Without clear answers, decisions about courses, coaching, and support are based on guesswork instead of evidence.

2. What We'll Build For You

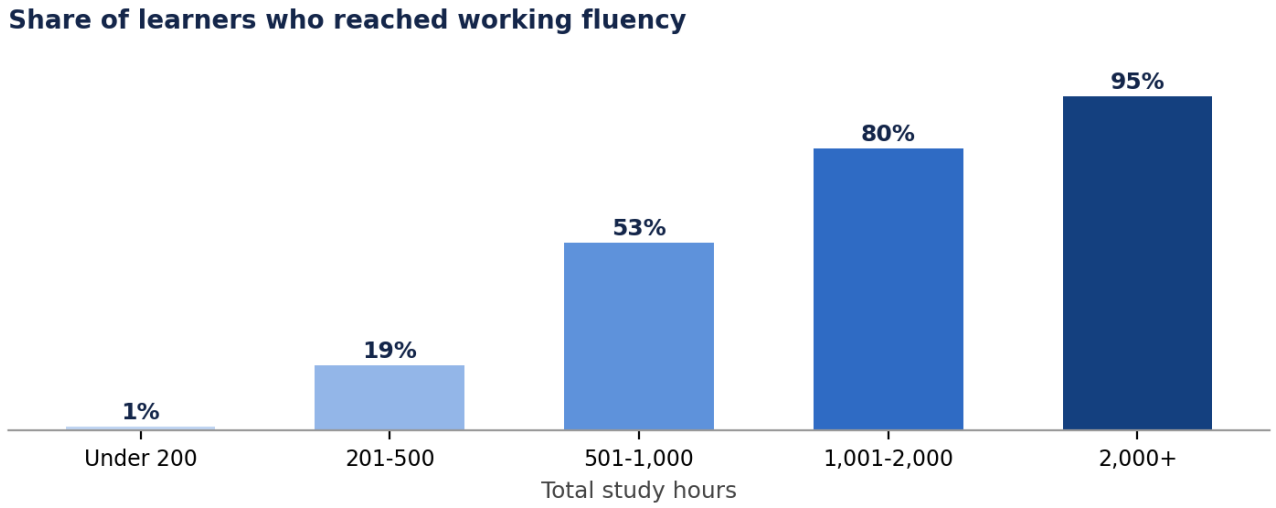
- **A clean, trustworthy version of your data**, checked record by record, with every decision written down.
- **A clear picture of what your data shows**, in plain language, not jargon.
- **A live dashboard** your team can open any time. It has four pages: an overview, what drives success, why learners quit, and how age affects results.
- **A short written report** with findings and recommendations you can act on right away.

3. The Value This Adds

Instead of...	You get...
Guessing what makes learners succeed	A ranked, evidence-based view of what matters most
Treating every learner the same	Clear groups to support differently, such as those at risk of quitting
Static, outdated reports	A live dashboard you can filter by language difficulty, age group, and study method
Decisions based on opinion	Decisions backed by numbers you can show anyone

4. Proof of Work

This is not theoretical. We recently ran this exact process on a public dataset of **45,000 language learners**. Every record was checked: no gaps and no repeated entries were found. We then organised the information into easy-to-read groups (for example age ranges and study-hour ranges) and built a four-page live dashboard. Here is a sample of what it revealed:



What we found	What it means for you
Study time is the strongest factor. Under 200 hours, about 1% reach fluency. Past 2,000 hours, 95% do.	Design programs that help learners keep going until the hours add up.
Language difficulty matters a lot. 54% reach fluency in the easiest group, but only about 10% in the hardest.	Set realistic timelines and give extra support to learners of harder languages.
Time spent living in the language helps. Fluency rises from 32% (none) to 62% (over a year).	Offer immersion options such as exchanges, trips, or conversation clubs.
Age does not change the chance of reaching fluency (about 35-40% in every age group). It does affect accent: the score falls from about 8 out of 10 for children to under 3 for learners over 50.	Do not discourage older learners. Set accent expectations by age.
Motivation and steady practice reduce quitting. The quit rate drops from 45% to 27% as motivation rises, and from 48% to 31% as consistency rises.	Invest in reminders, routines, and early encouragement.

Note: this example used a public practice dataset. Your results will come from your own learners.

5. Investment

Pricing depends on the size and condition of your data. Example packages:

Package	What's included	Price
Starter	Data cleaning + one summary report	$ _____
Standard	Data cleaning + analysis + live dashboard	$ _____
Full Service	Everything in Standard + ongoing monthly updates	$ _____ / month

Final pricing will be confirmed once we have reviewed your data.

6. Timeline

Week	What happens
Week 1	Receive your data, check it, and confirm the plan with you
Week 2	Clean and prepare the data
Week 3	Build the analysis and the dashboard
Week 4	Deliver the report, walk you through the dashboard, hand everything over

7. Next Steps

1. Reply to confirm which package fits you best.
2. Share access to your learner data.
3. We kick off within 48 hours of confirmation.
